

Omelo

Feature inventory — what is built, what is specified, and what is not yet started.
Generated 26 August 2026 from the running code and the live database.

87 Database tables	158 RLS policies	45 Published jobs	23 Screens built
-----------------------	---------------------	----------------------	---------------------

How to read this document

Omelo has a complete written specification covering far more than is currently implemented. This inventory separates the two honestly. **Built** means it runs against the live database and has been exercised end to end. **Partial** means part of the flow works. **Spec only** means it is designed and documented but no code exists yet.

What Omelo is

A universal employment platform. It is built to work equally well for a software engineer, a doctor, a teacher, a driver, an electrician, a cook, a security guard, a delivery worker and someone looking for their first job. Not a professional network, and not a white-collar job board with blue-collar roles bolted on.

A person can use Omelo with no degree, no formal employment history, no resume, no certifications and no assumed digital literacy. That constraint drives almost every design decision listed here.

The three surfaces

Worker app	Flutter — Android, iOS and web from one codebase. 5,000 lines.
Employer portal	Next.js 16 / React 19 web app. 2,800 lines.
Platform admin	Specified in detail, not yet started.

Worker app

Five permanent tabs: Home, Discover, Applications, Messages, Profile.

Getting started

Feature	Status	Notes
Language selection	Built	20 languages from the database, shown in their own script.
Country selection	Built	Drives currency, pay period and auth method via country policy. 9 supported countries.
Browse before signing up	Built	Real jobs are visible with no account. A worker burned by fake job sites will not register on faith.
Sign up / sign in	Built	Email and password, no email confirmation — the account works immediately.
Phone OTP sign-in	Spec only	Specified as the primary method for India. Needs an SMS provider configured.
Four-question onboarding	Partial	Designed as looking-for / where / what work / experience. Currently language, country and location only.

Finding work

Feature	Status	Notes
Nearby jobs by distance	Built	PostGIS distance search. Distance is the primary filter, not an afterthought.
Search	Built	Matches job title, company, profession, category and profession aliases.
Filters	Built	Distance, minimum pay, work type, shift, category, no-experience-only.
Quick filter chips	Built	No experience needed, part-time, full-time, night shift, daily wage.
Automatic radius widening	Built	If nothing is nearby the search widens and says so, rather than showing an empty screen.
Visible search origin	Built	The app always states where it is measuring from, so an empty result is explainable.
Job card	Built	Distance, pay with its period, benefits, verification badge, and the employer reply time.
Job detail	Built	Pay, location, hours, requirements, benefits, working conditions, hiring process, employer stats.
Company profile	Built	Reply rate, typical reply time, hires through Omelo, and their other open jobs.
Natural-language search	Spec only	Designed to resolve free text into editable filter chips.
Map view	Spec only	Pins and radius.
Saved jobs and alerts	Spec only	Tables exist; no UI yet.

Applying and tracking

Feature	Status	Notes
Quick apply	Built	No resume. Sends a structured profile and the employer question.
Apply preview	Built	Shows exactly what the employer will see — and explicitly what they will not.
Employer screening question	Built	Answered inside the app, never by redirect.
Duplicate-apply protection	Built	The job screen shows "you have applied" instead of a second submission.
Hiring timeline	Built	Applied, viewed, shortlisted, screening, assessment, interview, offer, hired.
Honest "employer viewed"	Built	Written when a recruiter actually opens the application. The employer cannot suppress or erase it.
Silence state	Built	Shows days without activity and the employer's usual reply time, instead of nothing.
Rejection with reason	Built	Always communicated, with the reason where given, and a route to similar work.
Withdraw	Built	Available at any non-terminal stage.
Messages with employers	Spec only	Job-anchored chat with structured actions, block and report.

Work identity

Feature	Status	Notes
Automatic work identity	Built	Created at signup, so a worker can apply immediately.
Multiple work identities	Partial	Fully modelled in the database — up to five per person, each with its own pay, availability and privacy. No UI yet.
Adaptive profile	Partial	Database resolves different questions per profession — a driver is asked about vehicle classes, a nurse about specialisations. No UI yet.
Skills, experience, education	Spec only	Tables and taxonomy exist. No editing UI.
Resume builder	Spec only	Question-led, voice input, generates a document. A primary feature, not a fallback.
Document vault and sharing	Spec only	Per-employer shares that the worker can revoke. Applying shares nothing.
Verification centre	Spec only	Phone, identity, licence, education, employment.
Who can find me	Spec only	Per-identity discoverability plus an employer blocklist.

Employer portal

Feature	Status	Notes
Sign up / sign in	Built	Email and password, no confirmation step.
Company onboarding	Built	Creates the company; the database grants owner role and free-tier limits automatically.
Dashboard	Built	Live counts, job slots used, and a stale-application warning stating that candidates can see it.
Job wizard	Built	Six steps: basics, location, pay, schedule, requirements, benefits.
Live matching-worker count	Built	Shows how many workers match as requirements are edited, so a requirement's cost is visible.
Pay benchmark	Built	Comparable live postings, normalised to a monthly figure. Refuses to show a range from fewer than three samples.
Automatic requirements	Built	Skills seeded from the profession taxonomy, so a skipped step still produces a matchable job.
Publish / pause / close	Built	Publishing makes the job visible to nearby workers immediately.
Pipeline stage mapping	Built	Employers name their own stages; the candidate-visible state cannot be invented or hidden.
Jobs list	Built	Status, pay, applicants and views.
Candidates list	Built	Everyone who applied, with a stale-application warning per row.
Company profile	Built	Editable, plus hiring-behaviour stats and the team list.
Open a candidate	Spec only	Must go through the function that writes the honest "viewed" state.
Move pipeline stages	Spec only	Kanban and list.
Rejection with required reason	Spec only	No bulk reject without a reason. No automated rejection, ever.
Messaging candidates	Spec only	Job-anchored, rate limited.
Interviews and scorecards	Spec only	Includes trial shifts and walk-ins, not only video calls.
Offers and employees	Spec only	An accepted offer becomes verified work history for the worker.
Talent search	Spec only	Deliberately gated: opt-in consent, company verification and entitlement, all three.
Team invitations	Spec only	Eight roles are modelled and enforced by database policy.
Analytics	Spec only	Funnel, time to hire, response behaviour, requirement cost.
Billing	Spec only	Entitlements are enforced today; no payment flow.

Platform and data

Feature	Status	Notes
Database	Built	87 tables, row-level security on every one, 158 policies, 40 enums, 31 triggers.
Universal job model	Built	One schema covers a hospital consultant and a daily-wage labourer. 66 columns on the job alone.
Work taxonomy	Built	34 categories, 92 professions, 118 skills weighted toward trades, 10 licence types.
Location data	Built	53 places across Delhi NCR with coordinates.
Pay normalisation	Built	Hourly, daily, weekly and annual pay compared on one scale. A daily wage job ranks correctly against a salary.
Match weight profiles	Built	11 profiles, per category, each validated to sum to exactly 1.0. Weights are data, not code.
Country policy	Built	14 countries. Currency, pay period, auth method and legal rules are configuration.
Verified hire loop	Built	An Omelo hire automatically becomes verified work history — often a worker's first credential.
Immutable application history	Built	Append-only event log. Employers cannot delete it or rewrite a submitted application.
Matching engine	Spec only	17 scored features, gates, and deterministic explainable scores. Weights and data are seeded; the scorer is not written.
AI subsystems	Spec only	Resume extraction, skill normalisation, job understanding, match explanation.
Career intelligence	Spec only	Career paths, skill gaps, opportunity delta.
Platform admin	Spec only	Moderation, taxonomy stewardship, fraud, country configuration.

Works on every screen

Both apps adapt across phone, tablet, desktop and web. The worker app switches from a bottom navigation bar to a side rail on tablets, and to an extended rail with labels on desktop. Card lists become two or three columns as the window widens rather than stretching into one very wide column, and reading-heavy screens cap their line length.

Phones	Verified from 320dp upward — iPhone SE through Pro Max, and common Android sizes.
Tablets	iPad portrait and landscape, Android tablets, foldables.
Desktop and web	Verified to 1920px.
Verification	Every portal page checked for horizontal overflow at 320, 768 and 1440px. 38 automated tests including real layout geometry.

What makes Omelo different

Employers cannot hide

An employer names their own pipeline stages, but the state a candidate sees is fixed by the database. "Employer viewed" is written when they actually open the application, and cannot be cleared, altered or deleted. This is enforced by database triggers, not by policy or good intentions.

No application disappears silently

Every application shows its real state and the time since the last action, including when that is nothing. Silence is a displayed state with a number attached, not an absence.

Distance is the primary filter

For a delivery worker, a cook or a security guard, a job across the city is not a job. Discovery is geospatial first, and the search origin is always visible so an empty result can be explained.

Money is never a bare number

Amount, currency and period always travel together. A daily wage is never displayed as a monthly figure, and internally all pay is normalised so the two can be compared fairly.

No resume required

Quick apply sends a structured profile instead. Requiring a resume removes most of the workforce from an employer's pool, and the job wizard says so at the moment the employer ticks the box.

Applying shares nothing

Documents move only through an explicit, revocable, per-employer share. Receiving an application grants an employer no access to a passport, licence or certificate.

Consent is a precondition, not a filter

Nobody appears in talent search without opting in. Blocking an employer produces absence, never a signal — a detectable block would endanger the person it protects.

A machine never rejects anyone

Match scores rank and explain; they do not decide. Rejection requires a human and a reason. There is no automated rejection rule, and there will not be one.

Known gaps worth naming

Phone OTP sign-in needs an SMS provider before launch, and email addresses are currently unverified, so password reset is not yet trustworthy. The matching engine is specified in full and its data is seeded, but the scorer is not written — job ranking today is by distance. The Android build has not been run on a device from this environment. None of these are hidden in the tables above.
